Does a GFM inverter have a frequency response capability?
A GFM inverter's frequency response capability may be impacteddue to its implicit prioritization of attempting to maintain voltage magnitude and phase angle in the sub-transient time frame. Thus,it does not maintain fixed active or reactive power on those timescales.

What is the control objective of a GFM inverter?
On the other hand,for a disturbance outside the normal operating range of voltage a GFM inverter's control objective,on the shortest [sub-transient]timescales (roughly 0-5 cycles after a disturbance),is to maintain the desired voltage magnitude and phase angleand prioritize the support of voltage magnitude and frequency at its terminals.

Do inverter manufacturers have different perceptions of GFM?
Currently,each inverter manufacturer may have a slightly different perceptionor position regarding the notion of GFM and its performance. As a result,for the same event on the power grid,there can be variation in response across each manufacturer.

How does a GFM IBR affect the performance of an inverter?
The GFM IBR's input sourcecan influence the performance of the inverter and may impact its ability to provide specific grid services. For example,a wind turbine's speed of response to frequency variations in the grid may be slower than a battery energy storage system's speed of response.
