Can a solar-wind system meet future energy demands?

Accelerating energy transition towards renewables is central to net-zero emissions. However, building a global power system dominated by solar and wind energy presents immense challenges. Here, we demonstrate the potential of a globally interconnected solar-wind system to meet future electricity demands.

Is solar-wind deployment suitable?

We evaluate the suitability of solar-wind deployment focusing on three aspects: solar/wind exploitability, accessibility, and interconnectability, as elaborated in Supplementary Table S3. 'Exploitability' pertains to the restrictions dictated by land use and terrain slope for installing PV systems and wind turbines.

What happens if solar-wind generation exceeds net power demand?

When solar-wind generation within a grid exceeds its net power demand (i.e., total demand minus baseload), surplus power is first transferred to interconnected grids experiencing shortages, with the remaining surplus stored until capacity is reached. Any surplus beyond storage capacity is curtailed.

How much does a solar-wind power outage affect electricity supply?

Under the S-G scenario, the decline in solar-wind electricity supply caused by the complete outage of a single regional grid averages only 2.6% (ranging from 0.7% to 11.7%), compared to declines of 5.8%, 15.1%, and 26.4% under the S-C, S-A, and S-I scenarios, respectively (Fig. 4b).

2 days ago · This work shows that climate change is projected to unevenly intensify extreme low-production events in solar and wind power systems worldwide, highlighting the need for ...

May 15, 2025 · A globally interconnected solar-wind power system can meet future electricity demand while lowering costs, enhancing resilience, and ...
