How do I install solar panels?

Ground-mounted panels can be installed anywhere with good sun exposure and enough open space. A minimum of 350 square feet is usually required. Installing solar panels requires the following steps: Plan the solar energy system based on the home's size, location and energy needs. Measure, cut and assemble the support structure for the solar array.

What equipment do I need to install a solar panel?

Mounting Hardware: Rails, bolts, and brackets securely attach panels to your roof or ground structure. Robust mounting is essential for wind and weather durability. **Balance of System (BOS):** This includes cables, conduits, disconnect switches, fuses, and monitoring systems. These ensure safe operation and allow for system monitoring.

What does a solar panel installation crew do?

The crew will install racking or mounts, fix the solar panels in place, and run electrical conduits. String inverters are usually mounted near the panels or at ground level to minimize wiring losses. If batteries are included (for backup or self-consumption), these are installed on a wall or in a mechanical room.
