What is a battery pack?

A battery pack is a set of any number of (preferably) identical batteries or individual battery cells. They may be configured in a series, parallel or a mixture of both to deliver the desired voltage and current. The term battery pack is often used in reference to cordless tools, radio-controlled hobby toys, and battery electric vehicles.

How does a battery pack work?

Connectors: To link the batteries together. They maintain the electrical flow and balance the load across all cells. Housing/Casing: This protects the internal components from physical damage and environmental factors. Battery packs work by connecting multiple individual cells in series or parallel to increase voltage or capacity.

How many cells are in a battery pack?

The number of cells within a module varies depending on the capacity required by the customer. A pack is a group of multiple modules connected together with a Battery Management System (BMS), a cooling system and various control/protection components. Packs are the final form of a battery that is installed in EVs.

What is the difference between a battery pack and a module?

Mechanical Support: Modules are housed in sturdy frames to provide structural integrity and protect cells from physical damage. A battery pack consists of multiple battery modules integrated to form a complete energy storage solution. Packs are engineered to deliver the required power and energy for specific applications.
