Is self-consumption a good idea for solar & home storage?

One concept gaining importance in the world of solar and home storage is self-consumption: producing and consuming your own electricity at your home or business. As net metering policies start to shift in the coming years, a self-consumption setup may be the key to maximizing your solar savings.

Is solar self-consumption a viable economic model?

Solar self-consumption is becoming the preferred economic model for several reasons: It reduces reliance on external energy sources, lowers electricity bills, and increases energy independence. Additionally, self-consumption solar promotes efficient use of generated power, minimizing wastage and enhancing sustainability.

How does solar self-consumption work?

Solar self-consumption is a natural process. The PV energy produced goes to the loads, because electricity takes the least resistant path. The path to the loads, which consists of cables and busbars, has a much lower resistance than the path to the transformer and the grid.
