Can a lithium ion battery pack have multiple strings?

Whenever possible, using a single string of lithium cells is usually the preferred configuration for a lithium ion battery pack as it is the lowest cost and simplest. However, sometimes it may be necessary to use multiple strings of cells. Here are a few reasons that parallel strings may be necessary:

Can a Li-ion battery pack have two arrays?

Deng et al. analyzed a novel layout for Li-ion battery packs using results and reports from CFD simulations. They proposed a battery pack with two arrays of cells and two parallel air-cooling channels.

Are cell capacity and pack size linked?

Obviously Cell Capacity and Pack Size are linked. The total energy content in a battery pack in its simplest terms is:  $\text{Energy (Wh)} = S \times P \times \text{Ah} \times V_{\text{nom}}$  Hence the simple diagram showing cells connected together in series and parallel. What about flexibility in pack size?

How many volts are in a battery pack?

If each cell is 10 amp hours and 3.3 volts, the battery pack above would be 10 amp hours and 26.4 volts (3.3 volts x 8 cells). For this setup, a BMS capable of monitoring 8 cells in series is necessary. Lithium cells can almost always be paralleled directly together to essentially create a larger cell.
