What is solar inverter based generation?

As more solar systems are added to the grid, more inverters are being connected to the grid than ever before. Inverter-based generation can produce energy at any frequency and does not have the same inertial properties as steam-based generation, because there is no turbine involved.

What are the different types of solar inverters?

Solar inverters come in various form factors: String/central inverters: Process multiple panel strings in parallel--commonly used in residential to utility-scale systems. Microinverters: One inverter per panel, offering per-module MPPT, higher shade tolerance, and modularity--but at a higher initial cost.

How do inverters provide grid services?

In order to provide grid services, inverters need to have sources of power that they can control. This could be either generation, such as a solar panel that is currently producing electricity, or storage, like a battery system that can be used to provide power that was previously stored.

How do solar inverters work?

In a large-scale utility plant or mid-scale community solar project, every solar panel might be attached to a single central inverter. String inverters connect a set of panels--a string--to one inverter. That inverter converts the power produced by the entire string to AC.
