-----  
What is battery management system (BMS)?

Battery Management System (BMS) is the "intelligent manager" of modern battery packs, widely used in fields such as electric vehicles, energy storage stations, and consumer electronics.

What is a battery management system?

A battery management system is a vital component in ensuring the safety, performance, and longevity of modern battery packs. By monitoring key parameters such as cell voltage, battery temperature, and state of charge, the BMS protects against overcharging, over discharging, and other potentially damaging conditions.

What data does a battery management system collect?

The BMS collects data such as voltage, temperature, current, and state of charge. This data is vital for system diagnostics and performance optimization. The BMS may communicate with other devices, such as vehicle controllers or cloud-based systems, to relay real-time information about the battery's condition and performance.

Why is a battery pack monitored by a BMS?

Each cell or group of cells in the battery pack is continuously monitored by the BMS to make sure they are operating within the specified parameters. Monitoring is crucial for real-time management as well as for gathering information that may be used to forecast the battery pack's future performance and health.
