Are base stations a threat to the safe operation of electric network?

Abstract: The ultra-dense deployment of base stations (BSs) results in significant energy costs, while the increasing use of fluctuating renewable energy sources (RESs) threatens the safe operation of electric network (EN). These issues can be addressed by coordinating BSs' active/sleep states with RES generation.

What is Europe electricity interconnection data?

Data on electricity use (flows) and potential (capacity) of the cross-border transmission grid across Europe and neighbouring countries. Ember's Europe Electricity Interconnection data tool allows users to explore the use (flows) and potential (capacity) of the cross-border transmission grid across European and neighbouring countries.

Why is interconnection important for Europe's energy transition?

Interconnection is the vital missing piece in Europe's renewable energy puzzle. Expanding cross-border electricity exchange will be critical to harnessing the full potential of new solar and wind power, preventing energy shortages, and reducing reliance on costly backup technologies. Europe's energy transition is gaining speed.

Should Europe double its interconnection capacity?

According to Ember's modelling, Europe must double its current interconnection capacity over the next 10-15 years to deliver on its energy targets and climate neutrality goals.

The energy sector constitutes a major economic activity for most countries in SE Europe with a significant contribution to infrastructure investment and market activity. Even more important is ...
