What is a virtual power plant (VPP)?

In straightforward terms, a Virtual Power Plant (VPP) is a network of smaller energy-producing and storage units, including solar panels, inverters, and batteries, working harmoniously to assist the electricity grid during periods of imbalance. The grid operates optimally at a frequency of 50 Hertz, ensuring it meets society's energy demand.

What is a virtual power plant?

Scientific Reports 15, Article number: 22693 (2025) Cite this article A virtual power plant consists of various sources, storage devices, and responsive loads. The operator of this unit can operate it as an energy storage device and transmitter in power distribution networks by controlling the active power of the aforementioned elements.

When will a virtual power plant be fully operational in Sweden?

Our VPP will be fully operational in Sweden by 2024. Quick Tech Exploration In straightforward terms, a Virtual Power Plant (VPP) is a network of smaller energy-producing and storage units, including solar panels, inverters, and batteries, working harmoniously to assist the electricity grid during periods of imbalance.

Is intelligent distribution system a coupling of virtual power plant and electric inverter?

This study presents the operation of an intelligent distribution system (IDN) as a coupling of the virtual power plant and electric inverter (CVE). CVEs participate in energy and active (flexibility market) and reactive (reactive power market) service markets simultaneously.
